I am using Internet TRS more frequently, thanks to the FCC and MCI WorldCom's and NexTalk.Net's collaborative IP-Relay program installed on my computer. However, my Caller-ID information is unavailable to local TTY users (many of my friends). Thus, I must disconnect my PC from the Internet to manually call these friends with my TTY. I'd very much like to see the FCC require ALL forms of TRS to pass my Caller-ID information through to the recipient of a TTY call from me. Most important to me, and anyone else using a Internet-based TRS, is the ability to make TTY calls from our computers, as if they were a TTY. This requires that the full 10-digit telephone number of the originating, or calling, party be passed through to the called party's Caller-ID system. Finally, I find it unacceptable for the FCC to decide and make a Final Rule that allows a TRS to pass to a called party's Caller-ID system any other number but my own. Thank you.
